Families want to know more about what their kids are learning in school, so they can support them at home. In the early grades, they are usually able to offer help. Then, students get older, the content gets more challenging; and students gain ownership over their learning. Suddenly, parents and caregivers can feel like they don’t have much help to offer. But that’s not the case. Research confirms that families still have a big role to play in helping students learn. It’s just a different role.

Especially now, as more learning is happening away from school buildings and on-line, how can families be supportive? In addition to providing encouragement, a study of more than 50,000 students found that relating what middle and high school kids are learning in school to their future life goals is one of the most effective ways families can help.¹ What doesn’t work? Trying to be directly involved with schoolwork. It can feel to high schoolers like you’re interfering or even confusing them. And this IS the time to encourage students to take more responsibility and be more independent.

This guide was developed so students and their families can understand the most important math content and skills students should learn in high school.

There are two math course pathways most commonly taught in U.S. high schools. One is the traditional course sequence of Algebra I, Geometry, and Algebra II. In recent years, some school have transitioned to teaching an integrated sequence, often called Integrated Math I, Integrated Math II, and Integrated Math III. The same content is taught in both pathways; it’s just in a different order and often at different times. Since these are the two most common approaches in U.S. high schools, we provide information on both below, by course title.

It’s worth noting that some students will begin this three-year sequence while they are in middle school, and many students will take additional math courses after they’ve completed this core set of courses. In addition to checking your state’s and district’s high school course graduation requirements, it’s also important that students think about their post-high school plans to determine how much more math they should take and which additional courses match their future goals.

**TRADITIONAL COURSE SEQUENCE**

**ALGEBRA I: WHAT HIGH SCHOOLERS ARE LEARNING**

Students taking Algebra I will spend the most time working on the following topics. By the end of the year, they should understand the topics well to provide a foundation for success in additional coursework and as preparation for both college and career.

- Creating equations and systems of equations to solve problems in context. For example, on June 21st, the day was four and a half hours longer than the previous night. How long was the previous night? Present the steps clearly and logically so that your classmates can follow along with your solution.

- Creating, analyzing, and applying functions. This work involves using equations, graphs, and tables that represent functions in different ways. The emphasis is on linear, quadratic, and exponential functions. For example, a mathematical model for farming predicts how much grain, $y$, will be harvested if a given amount of fertilizer, $x$, is applied. The model for the relationship is $y = 676 + 3.4x - (0.01754)x^2$, where $x$ and $y$ are measured in kilograms per acre or kg/acre. Is more fertilizer always better in this model? Estimate the best amount of fertilizer to use. (A graph of the relationship can be seen at [https://www.desmos.com/calculator/16ua1no8td](https://www.desmos.com/calculator/16ua1no8td).)

- Reasoning quantitatively and using units to solve problems. For example, a nurse needs to know how much of a medicine to give a child who weighs 10 kg. The child should receive 25 mg of medicine for each kg of body weight. The medicine is packaged in bottles of liquid with 750 mg of medicine per 15 ml of liquid. How many ml of liquid should the child receive?

- Interpreting and identifying ways to rewrite expressions, such as the difference of squares, factoring out a common monomial, or regrouping while writing expressions in equivalent forms to solve problems. For example, rewriting $2x^2 \cdot 3x^3 y^2$ as $6x^5 y^2$ or rewriting $[3t^2 + t] + [2 + t^2]$ as $4t^2 + t + 2$.

- Interpreting and comparing shape, center, and spread of realistic data sets to summarize, represent, and interpret categorical and quantitative data.
ALGEBRA I: TOOLS AND RESOURCES TO HELP

- Here is a readiness check on how well your student is applying linear functions through a game: [https://www.mathgames.com/skill/8.69-algebra-linear-function](https://www.mathgames.com/skill/8.69-algebra-linear-function)
- Practice activities to write linear functions based on a graph: [https://www.desmos.com/calculator/d0kidwd2uw](https://www.desmos.com/calculator/d0kidwd2uw)
- This online game provides practice with recognizing the graphs of quadratic functions by matching a given quadratic function with the graph that represents it: [http://www.purposegames.com/game/quadratic-functions-quiz](http://www.purposegames.com/game/quadratic-functions-quiz)
- Analyze the differences between exponential and linear functions in a series of activities: [https://www.khanacademy.org/math/algebra/x2f8bb11595b61c86:exponential-growth-decay](https://www.khanacademy.org/math/algebra/x2f8bb11595b61c86:exponential-growth-decay)
- Activities, videos, and tutorials using units to reason quantitatively: [https://www.khanacademy.org/math/algebra/x2f8bb11595b61c86:working-units/x2f8bb11595b61c86:word-problems-multiple-units/e/units](https://www.khanacademy.org/math/algebra/x2f8bb11595b61c86:working-units/x2f8bb11595b61c86:word-problems-multiple-units/e/units)
- Practice your skills in factoring various types of quadratic expressions through a game: [https://www.mangahigh.com/en/games/wrecksfactor](https://www.mangahigh.com/en/games/wrecksfactor)
- Activities for comparing and understanding data sets: [https://www.khanacademy.org/math/statistics-probability](https://www.khanacademy.org/math/statistics-probability)
- Videos and tutorials about quantitative data: [https://study.com/academy/lesson/what-is-quantitative-data.html](https://study.com/academy/lesson/what-is-quantitative-data.html)

GEOMETRY: WHAT HIGH SCHOOLERS ARE LEARNING

Students taking Geometry will spend the most time working on the following topics. By the end of the year, they should understand the topics well to provide a foundation for success in additional coursework and as preparation for both college and career.

- Understanding congruence and similarity in terms of plane transformation. Using congruence and similarity concepts to prove theorems, especially theorems about transversals, triangles, and quadrilaterals.
- Using area and volume formulas to solve real-world and mathematical problems of geometric measurement. For example, using volume formulas for cylinders, pyramids, cones, or spheres to solve problems, and applying geometric concepts to model situations.
- Defining trigonometric ratios and solving real-world problems involving right triangles.
- Working with geometric shapes in the coordinate plane, including by deriving the equation of a circle.
- Understanding independent and conditional probability, and using them to interpret data and compute probabilities of compound events.
GEOMETRY: TOOLS AND RESOURCES TO HELP

- Investigate congruence by manipulating the parts (sides and angles) of a triangle. [Link]
- Here’s a game to engage with transformations or a combination of transformations. [Link]
- This website reviews the relationship between angles, parallel lines, and transversals to help you lay the foundation for proofs. [Link]
- Try out this applet to prove triangle congruence. [Link]
- Concepts of volume are introduced through a unique and memorable song. [Link]
- Explore the trigonometric ratios to find an unknown side or angle in a right triangle. [Link]
- Videos that show you how to derive the equation of a circle in the coordinate plane. [Link]
- This series of videos takes you through multiple lessons on conditional probability. [Link]
- An interactive tool that shows the significance of conditional probabilities and independent events. [Link]
- Basics in understanding probability. [Link]

ALGEBRA II: WHAT HIGH SCHOOLERS ARE LEARNING

Students taking Algebra II will spend the most time working on the following topics. By the end of the year, they should understand the topics well to provide a foundation for success in additional coursework and as preparation for both college and career.

- Creating equations and systems of equations to solve problems in context. For example, at the circus, tickets are half price for kids younger than age 12. Our school bought tickets for 14 kids younger than age 12 and for 20 kids aged 12 and older. The total cost of the tickets was $108. How much is a circus ticket for a kid younger than age 12? Show the algebra steps you took to solve the problem. Present the steps clearly and logically so that your classmates can follow along with your solution.

- Creating, analyzing, and applying functions. This work involves using equations, graphs, and tables that represent functions in different ways. The emphasis is on polynomial, exponential, and trigonometric functions. For example, Susanna heard some exciting news about a celebrity. Within a day she told 4 friends who hadn’t heard the news yet. By the next day, each of those friends told 4 other people who also hadn’t yet heard the news. By the next day, each of those people told 4 more, and so on. Assume the news continues to spread in this way. Let \( N \) be the function that assigns to \( d \) the number of people who hear the news on the \( d^{th} \) day. Write an expression for \( N(d) \). On which day will at least 100,000 people hear the rumor for the first time? Show the algebra steps you took to solve the problem. Present the steps clearly and logically so that your classmates can follow along with your solution.
Interpreting and identifying ways to rewrite expressions, such as when simplifying rational expressions or when rewriting expressions involving radicals and rational exponents. For example, rewriting $\frac{x}{(x^2+3x)}$ as $\frac{1}{x+3}$; rewriting $7^{1.5}$ in any of the equivalent forms $7^{3/2}$, $\sqrt{49}$, $\sqrt[3]{7}$, or $7^{\sqrt{7}}$.

Relating zeros of polynomials to their factors. For example, to solve the equation $9x = x^3$, one can first rewrite the equation as $9x - x^3 = 0$. Next, one can factor the left-hand side to produce the equation $(x)(3 + x)(3 - x) = 0$. This form of the equation implies there are three solutions, $x = 0$, $x = 3$, and $x = -3$. The equation $9x - x^3 = 0$ can also be analyzed using a graph of the function $y = 9x - x^3$. (A graph of this relationship can be seen at https://www.desmos.com/calculator/x4nalzravs.)

Using the mean and standard deviation of a data set. Understanding and evaluating random processes underlying statistical experiments, and drawing conclusions based on graphical and numerical summaries.

**ALGEBRA II: TOOLS AND RESOURCES TO HELP**

High school is an opportunity for students to take more ownership of their learning. The content students learn will become increasingly sophisticated. Acknowledging your teen’s interests throughout this time can help to engage them in the study of mathematics.

Below are a few tips on how parents can encourage teens to engage with high school mathematics:

• Talk about the math your student is learning. What makes them feel successful? What new concepts are they learning? Where do they feel they need an additional math challenge or support?

• Find resources together that they feel are relevant and helpful to their course of study. Suggest that they talk to their teachers about the resources, extensions and practice activities they find.

• Ask students to name topics of study that are directly relevant to their world. For example,
  - In Algebra 1, students can calculate a trajectory for shooting a basketball into a hoop.
  - In Geometry, students can determine how much area is needed to install a pool, calculate the amount of water needed to fill the pool and estimate the time it will take to fill the pool.
  - In Algebra 2, students can examine how exponential functions can model real world features, such as trends in energy use.
  - In Math I, students can use exponential equations to understand and represent repayment models on future school loans.
  - In Math II, students can use probability to plan around how likely it is that they will need to file an insurance claim based on the percentage of drivers that hit a deer within the last year.
  - In Math III, students can use trigonometry and technology to graph sine and cosine functions that model sound waves in order to adjust volume and pitch.

• Encourage students to think about careers they might like to have when they are an adult. Help them learn about how math is a part of these jobs.
Sometimes, you’ll hear educators use a word that has a specific meaning in schools. Understanding those terms will help you speak the same language!

**Categorical data**
Data that can be separated into different groups, consisting of labels or non-numeric entries. This can include rankings (for example, finishing places in a race), classifications (for example, brands of cereal), and binary outcomes (for example, coin flips).

**Center**
In statistics, the center is the median and/or value of a data set. In geometry, the center is a point that is the same distance from all locations of the perimeter on the figure.

**Circle**
A circle is a closed plane curve consisting of all points at an equal distance from the center.

**Compound events**
The likelihood of two or more independent events happening at the same time.

**Conditional probability**
The likelihood of one event occurring with some relationship to one or more other events. For example, the probability \( P \) that event \( B \) occurs because event \( A \) has occurred, written as \( P(B|A) \).

**Congruence**
Two figures or shapes in the plane are congruent if they are identical in shape and size, or identical in shape and size after one or the other is reflected.

**Exponential function**
A nonlinear function of the form \( y = ab^x \), where \( a \neq 0 \), \( b \neq 1 \), and \( b > 0 \). The diagram shows graphs of two different exponential functions.

![Exponential Functions Graphs](image)

**Independent probability**
Two events are independent if the probability of one event is unrelated to the probability of the other event.

**Linear function**
Any function of the form \( f(x) = ax + b \) that makes a straight line when it is graphed.
**Mean**
A statistically “central” value of a set of numbers, calculated by adding all the numbers and dividing by how many numbers there are; sometimes called an average.

**Monomial**
An algebraic expression of one of the following types: a number (such as 47); a variable, possibly with whole-number exponents (such as \( z \) or \( x^3 \)); a product of several variables, possibly with whole-number exponents (such as \( xyz \) or \( p^2q \)); and/or a product of a number and one or more variables, possibly with whole-number exponents (such as \(-3a^2bc\)).

**Polynomial function**
A function, such as a quadratic, a cubic, a quartic, and so on, involving only non-negative integer powers of \( x \). When a polynomial function is completely factored, each of the factors helps identify zeros of the function.

**Quadratic function**
A function in one variable with the form \( y = ax^2 + bx + c \), where \( a \), \( b \), and \( c \) are real numbers, and where \( a \neq 0 \) or, in the vertex form \( f(x) = a(x - h)^2 + k \), where \( a \neq 0 \). The graph of a quadratic function is a “U shape” called a parabola.

**Quadrilateral**
A closed, two-dimensional shape with four straight sides.

**Quantitative data**
Consists of numbers that represent counts or measurements, for example, height, weight, or age.

**Quantitatively/Quantitative reasoning**
Knowing and flexibly using different properties of operations to create a coherent representation by considering units and attending to the meaning of quantities.

**Radicals**
Any expression containing a radical symbol, for example \( \sqrt{2} \), \( \sqrt[4]{\pi^4} \).

**Rational exponents**
Expressions with exponents that are rational numbers (as opposed to integers, which are whole and negative numbers).

**Rational expressions**
A ratio of two polynomials; a fraction in which the numerator and/or the denominator are polynomials.

**Shape**
In statistics, the ways to describe shape are by the number of peaks, the possession of symmetry, the tendency to skew, or the uniformity in the data set.

**Similarity**
Two shapes are similar if resizing one shape would make it congruent to the other shape; when shapes have equal corresponding angles and proportional corresponding sides. If two shapes are similar, one shape can become the other if the first can be resized onto the other.
Spread
In a data set, the spread is the measure of how far the numbers are away from the mean or median. The further the data values are from the mean or median, the greater the spread of the data.

Standard deviation
A measure of how spread out numbers in the data set are from its mean (see Spread).

System of equations
A set of two or more linear equations or inequalities with the same variables that need to be solved together. For example:

\[
\begin{align*}
\text{Equation 1: } & y = x - 1 \\
\text{Equation 2: } & y = 3x + 7
\end{align*}
\]

Transformation
A process that manipulates a polygon or other two-dimensional object on a plane or coordinate system. Mathematical transformations describe how two-dimensional figures move around a plane or coordinate system. Kinds of transformations include a translation (slide), reflection (flip), rotation (turn), dilation (resize), and glide (combination).

Transversals
Lines that cross at least two lines.

Trigonometric function
A function (such as the sine, cosine, tangent, cotangent, secant, or cosecant) of an arc or angle expressed in terms of the ratios of pairs of sides of a right-angled triangle.

Trigonometric ratios
These ratios, also known as trigonometric identities, relate the lengths of the sides of a right-angled triangle to its interior angles.

Volume
The amount of 3-dimensional space enclosed by a boundary or the amount required to fill an object.
TIPS FOR TALKING WITH TEACHERS

All students, particularly high schoolers who are engaged in more complex and sophisticated areas of study, should feel empowered to engage in conversation with their teachers about their progress and the content they are learning. Throughout the school year, students can use the following questions to ask teachers about their performance and self-assess:

• How can I apply what I already know to the content in this course?
• What are the expectations for success in this class? How do these criteria balance between effort and achievement?
• What do you see as areas of strength for me as a mathematician?
• Are there specific resources that I should be aware of to support my learning this year?

Families can also inquire about the content students will learn in class and how to provide support:

• What new content will be learned throughout the year? Which are the most important topics?
• Does my high schooler do better on problems involving more concrete tasks involving numbers or more abstract mathematical concepts?
• Are there topics that students are currently studying or will be learning about that connect to math they’ve already studied?
• Are there concepts that my teen may have missed out on from earlier this year that they need to go back and review in order to succeed on the material for the rest of this year?
Helping high schoolers see how what they are learning in school connects to their future is one of the best ways that families can support their kids. In addition to seeking out resources at school and in your community (community colleges are a great place to look), here are a few more ways to get started:

• Help your high schooler think about what jobs they might like to have, and then learn more about the education and training they need for a career in that field. [https://www.careerzone.ny.gov/views/careerzone/stem/index.jsf](https://www.careerzone.ny.gov/views/careerzone/stem/index.jsf)

• Does your high schooler like building and fixing things? Helping people? Learn more about how interests could lead to a career. [https://www.bls.gov/k12/students/careers/career-exploration.htm](https://www.bls.gov/k12/students/careers/career-exploration.htm)

• Have your high schooler visit/“shadow” someone who works in a career in which they are interested. Here are some virtual site visits to get started. [https://www.nebraskacareerclusters.com/](https://www.nebraskacareerclusters.com/)

• Has your high schooler expressed interest in a career in the military? Explore military careers here. [https://www.asvabprogram.com/](https://www.asvabprogram.com/)

• Find a pathway to success: A guide to help students learn how to translate their interests into one of 16 career clusters. [https://ed.sc.gov/instruction/career-and-technical-education/career-guidance/career-cluster-guides/](https://ed.sc.gov/instruction/career-and-technical-education/career-guidance/career-cluster-guides/)

• Learn the importance of math for careers and jobs: What teens need to know and how parents can help. [https://www.niu.edu/mathmatters/careers-jobs/index.shtml](https://www.niu.edu/mathmatters/careers-jobs/index.shtml)

• Are there colleges your high schooler has expressed interest in attending? Together, check out their admissions requirements, including their course-taking requirements. Make sure your student is prepared for and taking the classes they need not just to graduate from high school but to be eligible for college admission.
